

## SCOPE RESOLUTION OPERATOR

Operator- ::

Applications and their syntax:

- 1.) In order to access a global variable which has same name as local variable.

Ex. #include<iostream>

using namespace std;

int n;

```
int main()
{
    int n=2;
    cout << "global x is " << ::n; // n=0
    cout << "\nlocal x is " << n; // n=2
    return 0;
}
```

- 2.) To define a function outside a class

Ex. #include<iostream>

using namespace std;

```
class fn
{
public:
    int fun();
};
```

```
int fn::fun()
{
    cout << "Hi";
}
```

```
int main()
{
    fn a;
    a.fun(); // print Hi
    return 0;
}
```

### 3.) Multiple inheritance

Ex.

```
#include<iostream>
```

```
using namespace std;
```

```
class one
```

```
{
```

```
protected:
```

```
    int x;
```

```
public:
```

```
    one() { x = 10; }
```

```
};
```

```
class two
```

```
{
```

```
protected:
```

```
    int x;
```

```
public:
```

```
    two() { x = 20; }
```

```
};
```

```
class three: public one, public two
```

```
{
```

```
public:
```

```
    void fun()
```

```
    {
```

```
        cout << "one's x is " << one::x;
```

```
        cout << "\ntwo's x is " << two::x;
```

```
    }
```

```
};
```

```
int main()
```

```
{
```

```
    three o;
```

```
    o.fun();
```

```
    return 0;
```

```
}
```

### 4.) For namespace

Ex:

```
#include<iostream>
```

```
int main(){
```

```
    std::cout << "Hi" << std::endl;
}
```

5.) To use a class in another class

Ex:

```
#include<iostream>
using namespace std;
```

```
class out
{
public:
    int x;
    class in
    {
    public:
        int x;
        static int y;
    };
};
int out::in::y = 5;
int main(){
    outside A;
    outside::inside B;

}
```
